

BLOC-O-LIFT®-OBT for Hospital Bedside Tables

Product Information

This BLOC-O-LIFT® -OBT was specially designed for hospital bedside tables and allows variable height adjustment of the working area pursuant to BS 2483:1977 (i.e., 400 mm adjustment range) with simultaneous deflection in the compression direction.

If no deflection is desired, adjustment ranges of up to 300 mm are achievable. Both systems – comfortable spring deflection and rigid locking – allow the patient to use the upward motion of the table without the actuation mechanism. This simplifies handling of the tables and increases safety.

The BLOC-O-LIFT®-OBT product is characterized by variable locking capability in compression direction, while the device extends freely outside of the table or when the load is removed from the table.

Lowering only
with the actuation
mechanism

Lifting without
actuation
