

HYDRO-LIFT®

in Lamps, Terminals, and Medical Support Arms

Product Information

In addition to its diverse applications, HYDRO-LIFT® is used in lamps, terminals, and medical support arms. This gas spring allows variable positioning of the function element (monitor, lamp, telephone...) located at the end of the support arm. Even weight fluctuations between defined limits, for example due to varying loads, can be covered.

The support arm can be adjusted by applying a defined manual force and then be locked in the new rest position. Ultimately, one of the advantages of the HYDRO-LIFT® is that it does not require an actuation mechanism for adjustment.
