

LIFT-O-MAT® Self-locked in Compressed Position

Product Information

The LIFT-O-MAT gas spring made by STABILUS is well-known in the international furniture industry.

Based on the "push-button" ballpoint pen principle, STABILUS has developed a LIFT-O-MAT variant that self-locks in the compressed position. In this position, an internal mechanism locks the gas spring mechanically closed; a compression force disengages this lock, allowing the gas spring to extend normally.

This innovation has wide ranging application possibilities, for example "power-towers" in conference tables. It can also be used in sofa's, for backrest, armrest, and header adjustment; as well as in drink cabinets in a seating arrangement.
